NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(PCT Rule 71.1)

Date of mailing
(day/month/year)

02.02.2000

Applicant's or agent's file reference WO 2585-dV/jdh

International filing date (day/month/year)

Priority date (day/month/year)

IMPORTANT NOTIFICATION :

14/01/1998

International application No. PCT/EP99/00283

14/01/1999

Applicant

MINDPORT B.V. et al.

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

#### 4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

## V- Reasoned Statement

The following documents are cited: 1.

D1: US-A-5 392 353 (MORALES FERNANDO) 21 February 1995

D2: US-A-5 432 850 (ROTHENBERG MICHAEL) 11 July 1995

D3: EP-A-0 808 048 (AT&T CORP.) 19 November 1997

D4: STALLINGS W: 'INTERNET ARMOR' BYTE, vol. 21, no. 12, December

1996, page 127/128, 130, 132, 134 XP000641459

The subject-matter of claim 1 is concerned with the secure transfer of data from a 2. head end to a number of receivers. In order for the transmission to be secure, the transmitted data is scrambled and each receiver has a descrambler which requires a key to decrypt incoming data.

This kind of system is very well known in the art and forms the basis of most modern scrambled data transfer. In order for scrambled data to be transmitted, it is very obvious that the transmitter must possess a scrambler, and the receiver a descrambler with appropriate key.

The subject-matter of claim 1 further deals with how the receiver obtains its key. In claim 1, the key is sent to each receiver from the transmitter via the digital broadcast system. In the opinion of the examiner, it is an obvious measure to distribute the different keys. He is further of the opinion that, if the keys must be distributed, it is obvious to use the broadcast system. In fact, as the keys are required, the method of distributing them cannot be considered as involving an inventive step, whether they are distributed by courier, by post or over a broadcast network. Certainly in the case of claim 1, no surprising or inventive effect takes place.

As might be expected, the features of scrambled transmission and the descrambling thereof, and also the distribution of keys (also in an Internet environment) are found in the cited prior art documents (see passages cited in the international search report).

The applicant has argued that the difference between the subject-matter of the claims of the application and that of the prior art is that in claim 1, information intended for an individual receiver is supplied using a broadcast signal, whereas in documents D1 and D2, information is being sent point to point. This opinion is not shared by the examiner. It is true that in D1 or D2, a signal is supplied from an individual source, sent into the broadcast network and then can only be decrypted by an individual receiver. Taking only half of such a system, however, i.e. ignoring the source of the signal, one is left with a broadcast signal and an individual receiver which can decrypt the signal- just as in claim 1. Looked at alternatively, although signals in claim 1 are broadcast from a head end, in fact the signals intended only for an individual receiver must have an individual source. Thus, looked at one way, half of a system according to D1 or D2 is a broadcast system, or looking at claim 1 broadly but in the only way it can work, the system of claim 1 is a point to point system. Thus the aim and implementation of these systems is the same.

As the idea and the features of claim 1 are already well known and provide no surprising or inventive effect, claim 1 cannot be considered as involving an inventive step and does not therefore meet the requirements of Article 33(3) PCT.

2. Dependent claims 2 to 5 are not appended to an independent claim which meets the requirements of Article 33(3) PCT. Furthermore, their subject-matter does not appear to contain subject-matter which would add anything of inventive significance to that of claim 1. No features are disclosed which are not either already known from the prior art or which are not obvious to a person skilled in the art of transferring scrambled data

#### **VII- Certain Defects**

The following deficiencies are found in the application:

- a) The claims do not meet the requirements of Rule 6.2(b) PCT in that they do not contain reference signs.
- b) The independent claims do not meet the requirements of Rule 6.3(b) PCT in that they are not divided into the two-part form.

10

15

20

+31 20 5110931→

To be inserted on page 1, line 14

US-A-5 392 353 relates to an interactive satellite broadcast network, wherein encrypted communications ensure privacy of communications point-to-point in a network of interactive video stations interconnected by a broadcast network. Although a broadcast network is mentioned, this document refers to-point-point communications. Personal identification keys are used known only by the individual participating stations and a secure single central switching control center. The network control center intercepts communications encrypted as a function of the senders personal identification key and relays incoming communications designating the receiver in encrypted format as a function of the receivers personal identification key.

US-A-5 432 850 relates to a method and apparatus for secure data transmission, wherein a plurality of data frames are transmitted, each containing at least an encrypted data sequence employing the destination address as at least part of a decryption key. At the receiver side, the encrypted data sequence is decrypted by employing the local address of the receiver as at least part of the decryption key. In this known system each station can operate as a transmitting station using both the destination address and source address to encrypt the data.

EP-A-0 808 048 relates to a multimedia information service access, wherein a client can establish a connection 25 with a server where desired multimedia information is resident. By selecting the desired multimedia information and providing a client information identifying the location of the user, the multimedia information is delivered by the server to a bridging 5

10

[16]

apparatus through a switched network. It is indicated that the delivery of the multimedia information can be secured by comparing the client information to a segmented list to determine whether the client is authorized to receive the requested multimedia information.

The article "Internet Armor" by W. Stallings, Byte, vol. 21, no. 12, December 1996, page 127-134, describes a method to provide secure IP package by encrypting the IP packet and providing a new IP header with the destination address. This document however relates to transfer data through the Internet.

(54) Title: METHOD FOR TRANSFERRING DATA FROM A HEAD-END TO A NUMBER OF RECEIVERS

#### (57) Abstract

A method for transferring data from a head-end to a number of receivers by means of a digital broadcast signal is described, wherein each of the receivers includes a descrambler for descrambling a received digital transport stream. The method includes sending a message from the head-end to each receiver to which data needs to be transferred. This message includes a key unique to the respective receiver and the unique key is loaded in the descrambler of the respective receiver. A table of unique keys with corresponding addresses of the respective receivers is provided at the head-end. Further at the request of at least one receiver, data packets with an individual address of this at least one receiver are provided and these data packets are inserted into transport packets of a digital transport stream. A key is selected from the table in accordance with the address of the data packet and the transport packets are scrambled using the selected key. The digital transport stream is broadcasted and received at one or more receivers. The scrambled transport packets of the digital transport stream are descrambled only at the receiver having the unique key used to scramble the scrambled transport packets.

Method for transferring data from a head-end to a number of receivers

The present invention relates to a method for transferring data from a head-end to a number of receivers by means of a digital broadcast signal, each of said receivers including a descrambler for descrambling a received digital transport stream.

The use of a digital broadcast signal, such as a DVB signal, for transferring data to one or more receivers shows the advantage that available receivers with descramblers can be used to transfer the data from a head-end to the receiver. However, such a method would normally not allow for a data transfer in a secure and private manner as the data is accessible to all receivers listening to the digital transport stream.

10

20

25

The present invention aims to provide a method of the above-mentioned type wherein privacy and security of the data transfer can be provided to each receiver.

According to the invention a method of the abovementioned type is provided, including sending a message from
the head-end to each receiver to which data needs to be
transferred, said message including a key unique to the
respective receiver, loading the unique key in the
descrambler of the respective receiver, providing a table of
unique keys with corresponding addresses of the respective
receivers at the head-end, providing data packets with an
individual address of at least one of said receivers,
inserting said data packets into transport packets of a
digital transport stream, selecting a key from said table in
accordance with the address of the data packets, scrambling

2

said transport packets using the selected key, broadcasting the digital transport stream, receiving the digital transport stream at one or more receivers and descrambling the scrambled transport packets of the digital transport stream only at the receiver having the unique key used to scramble the scrambled transport packets.

5

10

30

In this manner a method is obtained wherein each receiver attempting to descramble the broadcast signal will fail to descramble the signal accept for the receiver(s) having the unique key(s) used to scramble the transport packets in which the data packets are inserted which are intended to be received by this receiver. This results in the desired privacy and security for the data transfer between the head-end and the receiver.

In a preferred embodiment for transferring data packets to two or more receivers, the data packets for different receivers are inserted into different transport packets, each of said transport packets being scrambled with a unique key corresponding with the individual address of the corresponding data packets.

In this manner data transfer with privacy and security is provided for a number of receivers requesting the transfer of data.

The invention will be further explained by reference to the drawings in which an embodiment of the invention is schematically shown.

In this preferred embodiment the method is used to transfer data requested by a receiver from the Internet to the receiver on a digital broadcast signal or digital transport stream, so that an Internet connection is obtained with a high speed transfer of data to the receiver according to the Internet Protocol. However the method described can

3

also be used to transfer data to receivers at their request or initiated by the head-end in another manner.

5

10

15

20

25

30

In the drawing a DVB system is very schematically shown by way of example, the system comprising head-end equipment 1 which will be indicated hereinafter by head-end, and a large number of subscribers having a receiver 2, only one of which is shown in the drawing. The receiver 2 includes a descrambler 3 co-operating with a smart card 4 in a usual manner. The descrambler 3 is used to descramble DVB services requiring a subscription. The receiver 2 is connected to the Internet 5 in a manner not further shown, for example by a well-known modem. If the receiver 2 requests the download of data, the data will be transferred to the receiver 2 via the head-end 1 by means of a broadcast signal in the following manner.

According to the internet protocol the data includes an IP or MAC address of the receiver 2 requesting the data to be transferred to this receiver. Each receiver 2 for which the head-end 1 receives data packets with an individual address, i.e. the IP or MAC address, is sent a so-called Entitlement Control Message or ECM with a control word or key which is unique to the receiver 2. This message is encrypted using an individual key which is stored in the smart card 4. At the head-end 1 the unique keys with the corresponding individual addresses are stored in a table 6. At the receiver(s) 2 to which an ECM is sent, the smart card 4 decrypts the received message using its individual key to obtain the unique key. The decrypted key is loaded into the descrambler 3 for future use.

At the head-end 1, the data packets for a specific receiver 2 requesting the transfer of data, are inserted into transport packets of the digital transport stream. Generally, the data packets are larger than the transport stream

4

packets, so that the data packets are split and thereafter inserted into a number of transport stream packets. Before scrambling the transport stream packets containing the data packets, the head-end checks the IP or MAC address and selects the corresponding unique key from the table 6, which key is used to scramble the transport stream packets.

5

10

25

30

Each receiver 2 listening to the digital broadcast signal attempts to descramble the transport stream packets of the digital transport stream, wherein however only at the receiver 2 having the unique key used for scrambling the transport stream packets, the descrambling process will be successful. In this manner only one receiver 2 will descramble the scrambled transport stream packets to thereby obtain the IP data packets.

15 From the above it will be clear that the described method results in a transfer of data with privacy and security for each receiver 2 requesting a data transfer.

Moreover, this transfer with privacy and security is achieved while using existing DVB or MPEG scrambling and descrambling equipment.

Generally, a number of receivers 2 will request the transfer of data. This is no problem as the head-end 1 will provide a table 6 including key/address combinations for each receiver 2 requesting a data transfer. The capacity of a digital broadcast signal is sufficient to transfer IP data packets to a large number of receivers 2. As the IP data packets for each particular receiver will be inserted into a number of transport packets wherein only these transport packets are scrambled using the unique key for this particular receiver, data transfer will still take place in a private and secure manner.

The data packets can be inserted into transport stream packets of a digital transport stream which is used

5

for the transfer of data only. As an alternative the data packets can be inserted into transport stream packets of a DVB transport stream as the capacity of such a transport stream is far more than necessary for transferring the video information.

5

10

Although in the preferred embodiment the method is used to transfer IP data packets, the described method can 5 also be used to transfer data from other sources than the Internet. Further, it is noted that instead of an ECM another type of message may be used to transfer a unique key to a receiver.

6

CLAIMS

1. Method for transferring data from a head-end to a number of receivers by means of a digital broadcast signal, each of said receivers including a descrambler for descrambling a received digital transport stream, said method including sending a message from the head-end to each receiver to which data needs to be transferred, said message including a key unique to the respective receiver, loading the unique key in the descrambler of the respective receiver, providing a table of unique keys with corresponding addresses of the respective receivers at the head-end, providing data packets with an individual address of at least one of said receivers, inserting said data packets into transport packets of a digital transport stream, selecting a key from said table in accordance with the address of the data packets, scrambling said transport packets using the selected key, broadcasting the digital transport stream, receiving the digital transport stream at one or more receivers and descrambling the scrambled transport packets of the digital transport stream only at the receiver having the unique key used to scramble the scrambled transport packets.

5

10

15

20

25

2. Method according to claim 1, wherein for transferring data packets to two or more receivers, the data
packets for different receivers are inserted into different
transport packets, each of said transport packets being
scrambled with a unique key corresponding with the individual
address of the corresponding data packets.

7

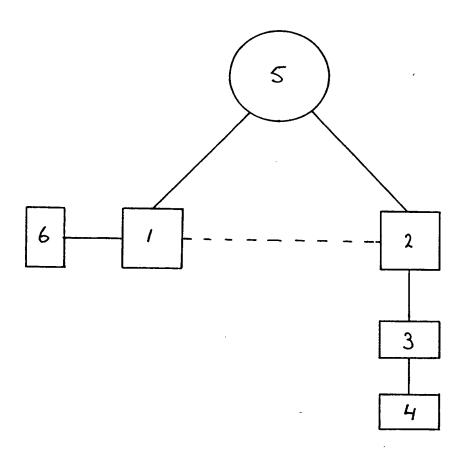

- 3. Method according to claim 1 or 2, wherein each receiver is adapted to request the transfer of specific data from the head-end.
- 4. Method according to claim 1, 2 or 3, wherein the head-end and the receivers are connected to a network, for example the internet, wherein one or more receivers request the transfer of data from the network, wherein the requested data together with the address of the requesting receiver(s) is provided to the head-end in the form of data packets and the head-end transfers the data packets to said one or more receivers inserted in transport packets of the digital broadcast stream.

5

10

15

5. Method according to any one of the preceding claims, wherein the digital transport stream is a DVB transport stream.
